

Mana Pools, ZWE

Forest Loss 2001–2025

Image of protected area and/or unique wildlife

Overview of site (≈200 words)

Mana Pools lies in Zimbabwe, covering 212,213 hectares and designated IUCN II. The surrounding comparison area — a 40 km terrestrial buffer excluding other protected areas — spans 2,540 km².

Interpretation of Results (≈200 words)

Over the 2001–2025 study period, Mana Pools lost 37.8% of its forest cover on a normalized mean-loss-year basis, compared to 61.6% for the 40 km comparison zone, yielding a treatment effect of roughly 23.8% increased loss inside the protected area (equal to approximately 6.0 years of forest life lost). A canopy-height similarity of 146.1% indicates the comparison area is structurally well-matched to the protected forest.

Key Results

Protected Area Loss	37.8%
Comparison Zone Loss	61.6%
Treatment Effect	23.8%
Canopy Similarity	146.1%
Years Saved (est.)	6.0

Conclusion (≈100 words)

Protection status in Mana Pools appears to have been ineffective at limiting deforestation within site boundaries. The protected area experienced 37.8% forest loss compared to 61.6% in the comparison area over the 2001–2025 study period.
