

Thap Lan, THA

Forest Loss 2001–2025

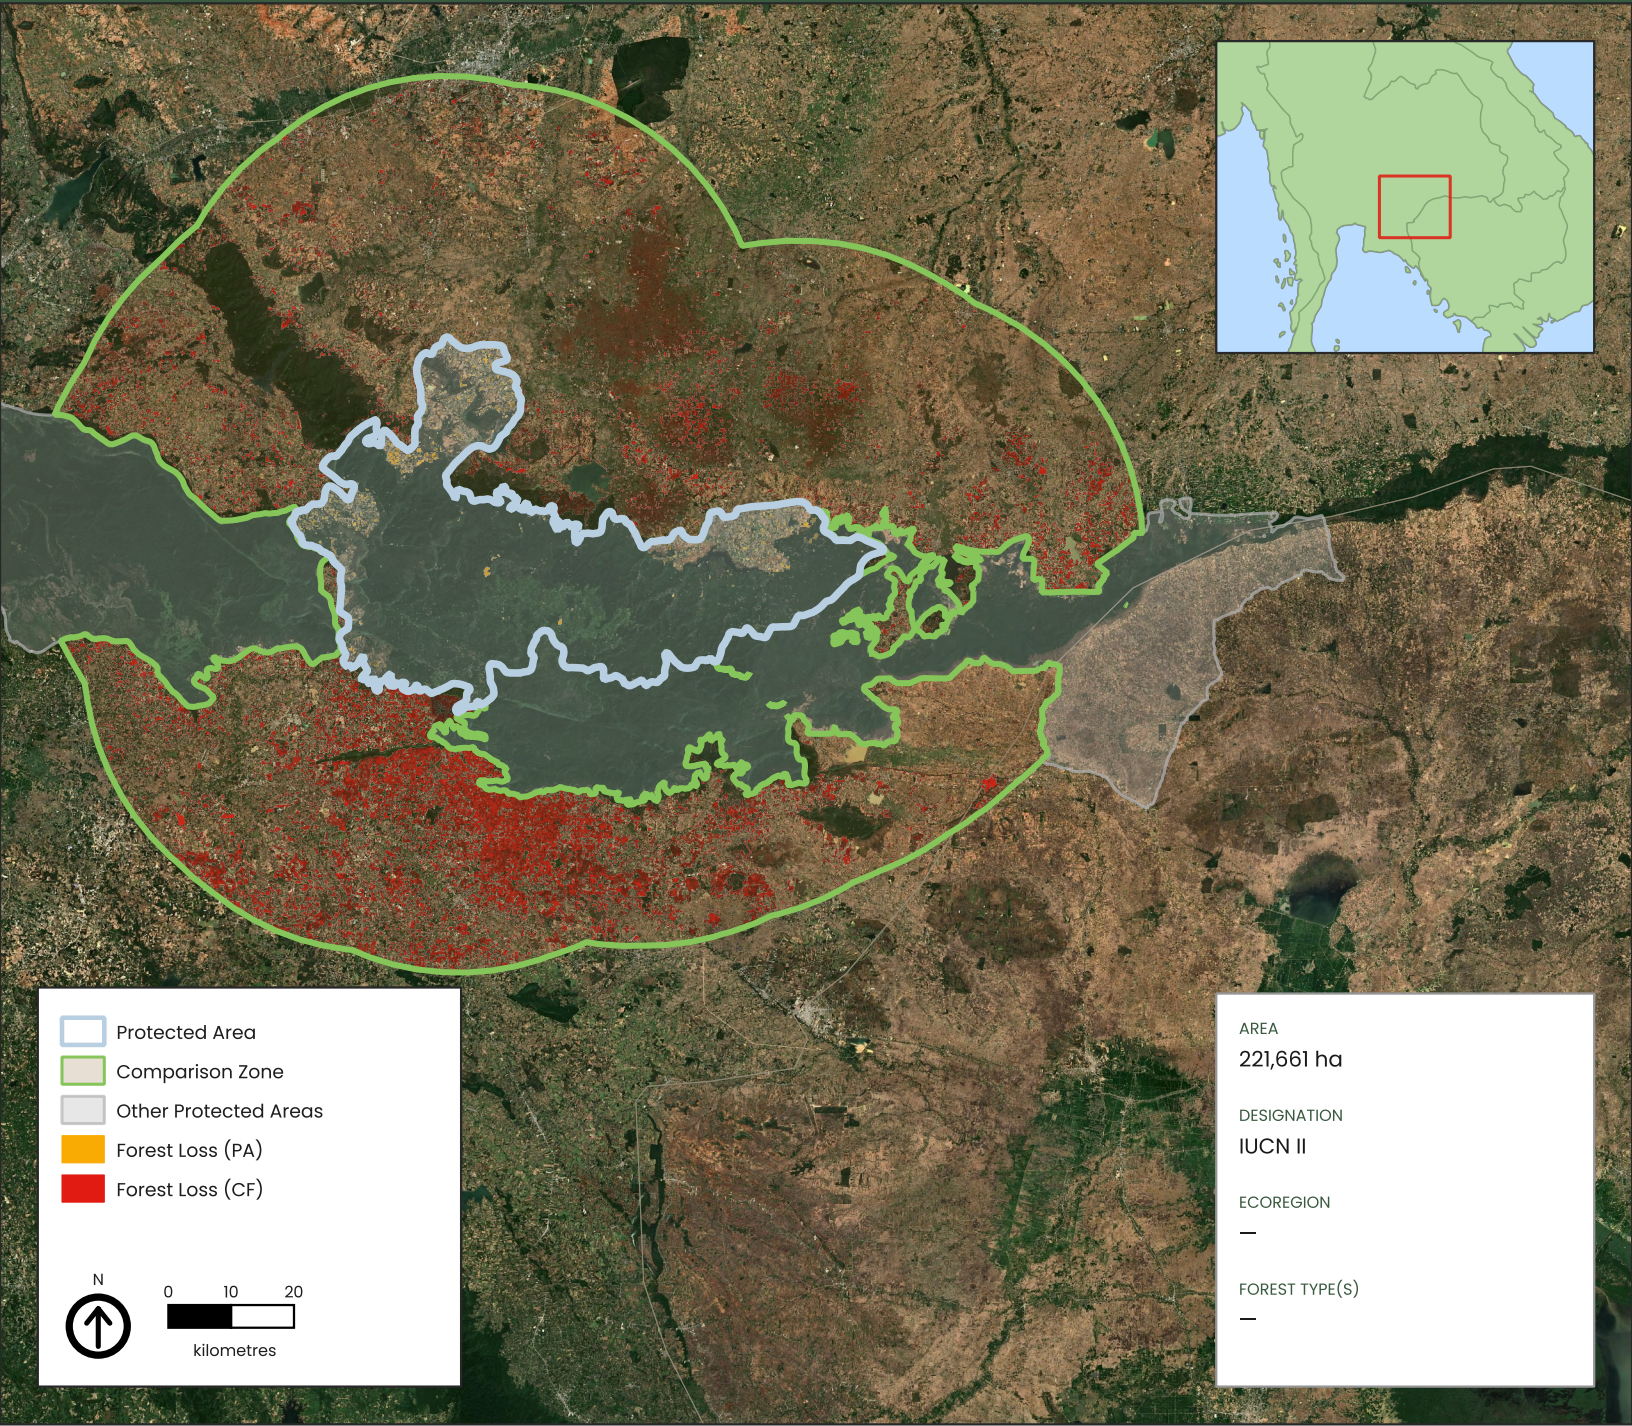

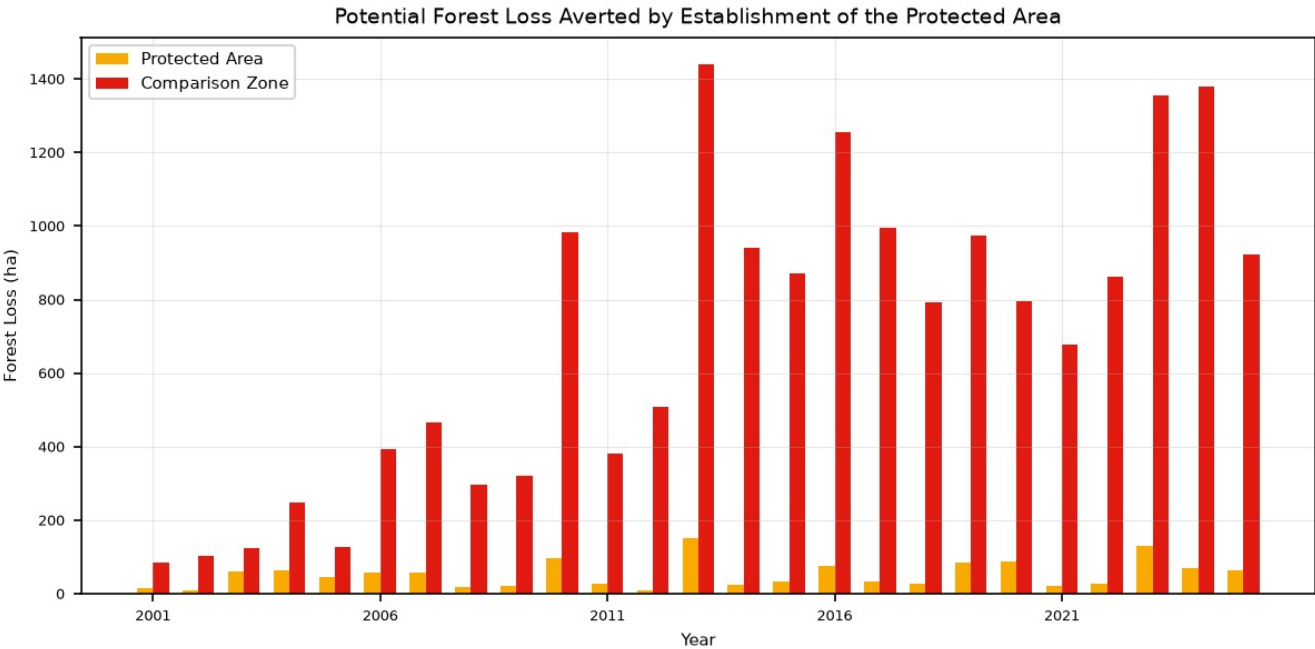

Image of protected area and/or unique wildlife

Overview of site (≈200 words)

Thap Lan lies in Thailand, covering 221,661 hectares and designated IUCN II. The surrounding comparison area — a 40 km terrestrial buffer excluding other protected areas — spans 11,885 km².

Interpretation of Results (≈200 words)

Over the 2001–2025 study period, Thap Lan lost 70.3% of its forest cover on a normalized mean-loss-year basis, compared to 74.8% for the 40 km comparison zone, yielding a treatment effect of roughly 4.4% increased loss inside the protected area (equal to approximately 1.1 years of forest life lost). A canopy-height similarity of 41.5% indicates the comparison area is structurally well-matched to the protected forest.

Key Results

Protected Area Loss	70.3%
Comparison Zone Loss	74.8%
Treatment Effect	4.4%
Canopy Similarity	41.5%
Years Saved (est.)	1.1

Conclusion (≈100 words)

Protection status in Thap Lan appears to have been ineffective at limiting deforestation within site boundaries. The protected area experienced 70.3% forest loss compared to 74.8% in the comparison area over the 2001–2025 study period.
